1 Problem

In Figure 1, the radius of the small circle (black) is the same as the edge length of a square. What is the value of $\tan(\angle ACB)$?

Figure 1: Problem's figure

2 Solution

From Figure 1, the inscribed angle $\angle ACB$ has its intercepted arc \widehat{AB} (with angle $\angle AOB$). Because inscribed angle is half of its intercepted arc, we have:

$$\angle ACB = \frac{1}{2} \times \angle AOB. \quad (1)$$

Let point D (as shown in Figure 2: 'Problem's figure annotated with sizes' on page 2) be the bottom center (crossing point) of the 2 squares. Due to symmetry $\angle AOD = \frac{1}{2} \times \angle AOB$, and hence:

$$\tan(\angle ACB) = \tan(\angle AOD). \quad (2)$$

[†]The creator

Figure 2 shows Figure 1 which is annotated with sizes relevant to the solution. Let point O be the center of the big red circle. Also, let the edge length of the square (which is also the radius of the small black circle) and the radius of the big red circle be a and R , respectively.

Figure 2: Problem's figure annotated with sizes

Let \overline{XY} and $|\overline{XY}|$ be line segment XY and its length, respectively. Looking at right triangle $\triangle ODG$ and applying Pythagoras' theorem:

$$\begin{aligned} |\overline{OD}|^2 + |\overline{DG}|^2 &= |\overline{OG}|^2 \Rightarrow |\overline{OD}|^2 + a^2 = R^2 \\ &\Rightarrow |\overline{OD}| = \sqrt{R^2 - a^2}. \end{aligned} \quad (3)$$

Also from Figure 2, we have:

$$\begin{aligned} |\overline{OD}| + |\overline{OT}| &= |\overline{DT}| \Rightarrow |\overline{OD}| + R = |\overline{DF}| + |\overline{FT}| \\ &\Rightarrow |\overline{OD}| + R = a + 2a \\ &\Rightarrow |\overline{OD}| = 3a - R. \end{aligned} \quad (4)$$

From equation (3) and (4), we have:

$$\begin{aligned} \sqrt{R^2 - a^2} &= 3a - R \Rightarrow R^2 - a^2 = (3a - R)^2 \\ &\Rightarrow R^2 - a^2 = 9a^2 - 6aR + R^2 \\ &\Rightarrow 6aR = 9a^2 + a^2 = 10a^2 \\ &\Rightarrow 6aR = 10a^2 \quad (a \neq 0) \\ &\Rightarrow R = \frac{5}{3}a. \end{aligned} \quad (5)$$

Now look at right triangle $\triangle EFO$.

$$\begin{aligned}
 \tan(\angle AOD) = \tan(\angle EOF) &= \frac{|\overline{EF}|}{|\overline{FO}|} \\
 &= \frac{a}{2a - R} && \text{(from Figure 2)} \\
 &= \frac{a}{2a - \frac{5}{3}a} && \text{(substituting } R \text{ from equation (5))} \\
 &= \frac{a}{\frac{1}{3}a} \\
 &= 3.
 \end{aligned} \tag{6}$$

Hence, $\tan(\angle ACB) = \tan(\angle AOD) = 3$. ■
